

Prompt Engineer

1. Resume –

Weak Prompt:

Create a resume for a college student. He likes football. he's into IT. He plays games.

Strong Prompt:

Design a one-page resume for a final-year Computer Science student applying for entry-level data analyst roles. Highlight projects involving data analysis, Python, and visualization tools. Use a clean structure with measurable achievements and keep the tone professional.

Comparison:

The use of keywords and specifying the results and expectations in a strong prompt give a more nuanced response as compared to the weak prompt.

2. Business Idea –

Weak prompt:

give me a startup idea that would make a lot of money

Strong prompt:

Propose a practical business idea that solves a real problem faced by college students in urban areas. The idea should be low-cost to start, scalable, and tech-enabled. Include problem statement, solution, target users, and potential revenue streams.

Comparison:

Specifying the target audience/end users, the location, and the ideal parameters for the startup gives a more curated response that can actually be built on, as opposed to the weak prompt where the end goal is only one parameter, which is not even certain.

3. Study Plan –

Weak Prompt:

Create a 30-day study plan for a semester.

Strong Prompt:

Create a detailed 30-day study plan for a beginner, outlining clear weekly goals and daily tasks. Include a consistent routine with regular mini-projects and periodic tests to track progress and reinforce learning.

Comparison:

Include all expectations in the prompt for a proper response.
